Omnichroma

Tokuyama Dental's Omnichroma is the first universal composite that matches every patient's tooth shade, from A1 to D4, with a single shade of composite.

Omnichroma's innovative technology utilizes structural color to match every tooth shade. Its 260nm fillers are the precise shape and size necessary to generate red-to-yellow structural color as ambient light passes through the composite. The red-to-yellow color combines with the reflected color of the patient's surrounding dentition, resulting in a perfect match with no added dyes or pigments.

The product saves doctors time and money by removing the need for shade selecting and eliminating the need to keep excess product for incidental shades. Omnichroma streamlines the restorative process, providing a single shade composite for every shade of tooth.

HIGHLIGHTS

- Omnichroma reduces the need for shade selecting and eliminates the need to keep excess product for shades that are rarely used, ultimately **saving doctors time and money**. Moreover, doctors will reduce the amount of composite they end up having to throw out due to it never being used and expiring. Inventory will also be reduced and simplified as Omnichroma streamlines the restorative process to a single shade.
- Doctors can rely on Omnichroma to **perfectly match their patients' teeth** without any subjective measures or shade matching guides. Likewise, patients will feel confident knowing that the procedure will result in a beautiful, strong, natural-looking restoration. The simplified shade-matching process will benefit both doctor and patient with reduced chair time and reliable restorative results.
- With its revolutionary **Smart Chromatic Technology**, Omnichroma provides a greater shade match not only at time of placement, but throughout the life of the restoration, adjusting in shade as teeth lighten or darken over time.
