Carriere Motion 3D Class II appliance

The Carriere Motion 3D Class II appliance and the “sagittal-first” treatment philosophy it powers are fueling a fundamental change in orthodontics, making treatment more efficient, comfortable and convenient. Effective for quick and aesthetic bite correction, the appliance is an ideal complement to every aligner case. By achieving a Class I platform in as little as three to six months before starting aligners, overall treatment time and the number of aligners required can be significantly reduced.

Motion 3D does the heavy lifting of A/P correction when there are no competing forces in the mouth and patient buy-in is at its peak. Important to aesthetic-minded patients, its unique design makes it hardly noticeable in the mouth. The appliance is as easy to place as a bracket or buccal tube. Bonding takes about 15 minutes and can easily fit into a same-day start protocol, increasing conversion rates with a simple, virtually invisible appliance.

Dr. David Paquette’s simple bonding technique ensures a streamlined approach to bonding and enables a same-day Motion 3D start, no matter how busy the practice is. With “sagittal-first” philosophy and a Motion 3D clear appliance, aligner treatment can be simpler and more predictable.
