

TOKUYAMA

OMNICHROMA

Omnichroma is a universal composite that matches every patient's tooth, from A1 to D4, with a single shade. Available in a flowable or packable form, Omnicroma products do not contain dyes or pigments and solely depend on structural color—a natural phenomenon—to shade match.

Omnichroma's 260-nm supra-nano spherical fillers have the precise size and shape necessary to generate the red-to-yellow color range of human teeth, and naturally shade-match as ambient light reflects off the surrounding dentition and passes through the composite. This Smart Chromatic Technology has been the culmination of 35 years of research by Tokuyama Dental.

Omnichroma products save doctors time and money by eliminating the need for shade selection and keeping excess products for incidental shades on hand. Streamline the restorative process with only one shade for all direct restorations that will continue to shade match even with color deviations such as post-bleaching treatments or darkening over time.

HIGHLIGHTS

- Exceptional physical and mechanical properties: low shrinkage, low wear and abrasion, high compressive and flexural strength, high polishability and stain resistance.
- Unprecedented shade-matching ability and aesthetics both before and after bleaching.
- Reduction of excess inventory and composite waste.
