ISOLITE DENTAL ISOLATION SYSTEMS

The Isolite System is your all-in-one solution for efficient dentistry. From visibility to moisture control and patient safety, every feature is designed to help you perform better dentistry in less time. It allows treatment across two quadrants simultaneously, significantly reducing the number of appointments per treatment plan and providing more availability for new patients. Practices using Isolite report procedure time reductions of up to 50%.

Key advantages include improved anterior and posterior access, simplified isolation, and a reduction in overall chair time. It provides soft tissue retraction and hands-free suction, streamlining workflow. The system's mouthpieces incorporate integrated bite blocks and airway protection, substantially enhancing patient safety and reducing the risk of aspiration. Clinicians also frequently report that Isolite has alleviated their concerns regarding the ingestion of dental materials.

Say goodbye to the constant battle against saliva. Isolite offers dual-channel suction that removes fluids from both sides of the mouth simultaneously, utilizing the integrated bite block with rear suction port to significantly reduce pooling in patients' mouths. It is designed to keep fluids, humidity and debris out of the area

you're working on—making you more efficient and improving your bonds. With the patient's mouth gently maintained in an open position and the operative field fully isolated, clinicians can maintain focus, reduce fatigue and improve procedural accuracy.

HIGHLIGHTS

- **Shadowless intraoral illumination.** Isolite Pro's built-in illumination avoids the harsh glare and awkward angles of overhead lights. Instead, it provides focused, unobtrusive lighting inside the mouth.
- **Perfect for light-sensitive materials.** The non-curing amber light of the Isolite Pro allows placement of light-sensitive materials precisely without it setting prematurely—giving clinicians flexibility and accuracy.
- **Dual-lever suction:** The dual-lever suction system removes fluids from both sides of the mouth simultaneously and can be adjusted independently for upper and lower control.
