Halo Sectional Matrix System

Create beautiful, predictable composite restorations in less time with the Halo Sectional Matrix System. Designed to help clinicians achieve tight interproximal contacts and natural contours with ease, the Halo system helps reduce finishing and polishing time by minimizing flash and creating natural anatomy right from the start.

Successful, long-lasting composite restorations depend on accurate contours and reliable contacts. The Halo system combines nitinol rings, stainless steel matrix bands, and wedges engineered to work together seamlessly for consistent, efficient results. The anatomically-designed components adapt naturally to tooth structure, helping simplify placement while supporting excellent restorative outcomes.

By reducing the need for adjustment after curing, the Halo system helps streamline workflows, improve efficiency, and enhance the patient experience. Whether placing routine posterior composites or tackling more complex

restorative cases, clinicians can feel confident achieving predictable results in less time.

Designed for performance and ease of use, the Halo Sectional Matrix System helps deliver restorations that look natural, function properly, and save valuable chair time.

HIGHLIGHTS

- Anatomically designed system helps minimize flash, reducing finishing and polishing time for more efficient composite restorations.
- Nitinol rings, matrix bands, and wedges work together to create predictable contacts and natural contours with consistent results.
- Convenient carousel dispenser keeps components organized, accessible, and secure to help streamline restorative procedures.
