

Ultralight Optics Omega Cordless Hybrid LED Headlamp

The best of both worlds

Ultralight Optics was founded in 2007 by Dr. Ron Nguyen while he was a dental student at the University of Southern California. Back then, it introduced a small, lightweight LED headlamp, the Feather Light LED, which helped initiate the mass adoption of LED headlamps in dentistry.

Truly made directly by dentists for dentists, Ultralight Optics' new Omega Cordless Hybrid LED headlamp is a revolutionary design that provides the lightest-weight cordless headlamp with adaptors that fit any loupes and eyeglasses.

The innovative engineering in the Omega Cordless Hybrid combines primary and secondary

benefits of both corded and cordless light systems, plus new advanced features. It successfully eliminates the long cord while still providing a long-lasting, lightweight battery. The ergonomic battery rests comfortably along the contours of a shirt collar (like cordless headphones that rest on the neck) and provides eight hours of power.

Each feature is unprecedented in a cordless headlamp, including seven levels of intensity control, a battery-life indicator, and a completely glove-free operation that eliminates contamination risk. The Omega Cordless Hybrid captures every functional aspect of illumination necessary

in dentistry, ergonomics and vision. Simply put, it's a cordless light with all the benefits of a corded light while having none of a corded unit's drawbacks. Get the best of both worlds!

By combining the Omega Cordless Hybrid with Ultralight Optics' Feather Sight Loupes, users can have one of the lightest, most comfortable cordless loupes and light combinations possible.
